

SILICA DUST

It will take your breath away.

Crystalline silica is in nearly all that we call sand and rock. It is harmless when dormant but when disturbed and airborne – as it often can be in hydraulic fracturing or drilling – it can be deadly. Prolonged or intense inhalation of silica dust can lead to silicosis – a disabling, sometimes fatal lung disease that can make breathing as if through a straw. But it doesn't have to be. Learn how you can protect yourself and others from exposure to silica dust by visiting enform.ca or by **picking up the Fall 2015 issue of *Frontline***.
